Introduction to Heat

Heat is a form of energy transfer that occurs between systems or objects due to a temperature difference. It plays a crucial role in everyday life, from cooking and weather patterns to industrial processes and energy production. The study of heat involves understanding how energy moves, how it affects matter, and how it can be measured and controlled.

Basic Concepts of Heat

Definition of Heat

Heat is the energy transferred between objects or systems because of temperature difference. It flows from a hotter object to a colder one until thermal equilibrium is reached.

Temperature vs. Heat
