Navathe discusses several key database models, including:

- **Hierarchical Model:** Data is organized in a tree-like structure where each parent can have multiple children, but each child has only one parent.
- **Network Model:** Data is represented as records with multiple relationships, forming a graph structure allowing complex relationships.
- **Relational Model:** Data is stored in tables (relations), with relationships established via foreign keys. This is the most prevalent model today.
- **Object-Oriented Model:** Incorporates object-oriented features like classes and inheritance, used in object-oriented databases.

Define key terminology in Navathe's database systems.

- **Entity:** An object or thing in the real world with a distinct existence, represented as a record in a table.
- **Attribute:** A property or characteristic of an entity or relationship (e.g., name, age).
- **Primary Key:** A unique identifier for a record within a table.
- **Foreign Key:** An attribute in one table that references the primary key of another table.
- **Normalization:** The process of organizing data to reduce redundancy and dependency.

Database Design Principles

What are the fundamental steps in designing a database according to Navathe?

The typical steps include:

- **Requirement Analysis:** Understanding what data needs to be stored and how it will be used.
- **Conceptual Design:** Creating an ER (Entity-Relationship) diagram to model entities, attributes, and relationships.
- **Logical Design:** Converting the ER diagram into a relational schema, defining tables, keys, and constraints.
- **Physical Design:** Deciding on storage structures, indexing, and other physical aspects to optimize performance.

What is an ER diagram, and why is it important?

An ER diagram visually represents entities, their attributes, and relationships. It helps:

- Clarify system requirements
- Identify entities and their relationships
- Ensure database consistency and completeness
- Serve as a blueprint for logical schema design

What are the rules of normalization in Navathe?

Normalization involves applying a series of normal forms:

- **First Normal Form (1NF):** Eliminate repeating groups; ensure atomicity of data.
- **Second Normal Form (2NF):** Achieve 1NF and remove partial dependencies (non-key attributes dependent on part of a composite key).
- **Third Normal Form (3NF):** Achieve 2NF and remove transitive dependencies (non-key attributes depending on other non-key attributes).
- **Boyce-Codd Normal Form (BCNF):** A stronger version of 3NF, addressing certain anomalies.

```

```
WHERE major = 'Computer Science';
```

```
```
```

This retrieves the names and ages of students majoring in Computer Science.

- Atomicity: All operations succeed or none do.
- Consistency: The database remains valid after the transaction.
- Isolation: Transactions do not interfere with each other.
- Durability: Once committed, changes are permanent.

What are the ACID properties?

The four key properties of transactions:

- **Atomicity:** All parts of a transaction are completed or none are.
- **Consistency:** Transactions bring the database from one valid state to another.

- **Isolation:** Concurrent transactions do not affect each other's execution.
- **Durability:** Committed transactions are permanently recorded.

How does Navathe explain concurrency control?

Concurrency control mechanisms ensure multiple transactions can occur simultaneously without conflicts. Techniques include:
